

Preview an Event

You can preview events using the [Monetate Inspector](#) browser plug-in. Click the **Components** tab and then click **Events**.

Recent updates to Safari Intelligent Tracking Prevention (ITP) block third-party cookies on your website. This update means that preview mode and the Monetate Inspector browser plug-in may not work in Safari. Monetate has developed an alternative approach to delivering preview mode to the site, and clients must contact Support to have this option enabled for their account.

No workaround is available at this time for the Inspector tool. Instead, use a different browser such as Chrome to use Monetate Inspector.

Event	Name	Arguments	Status
Page Event 12345	trackApi	reached_platinum	Occurred

Loaded events that have not yet occurred are listed as **Pending**. Events that have occurred are listed as **Occurred**. Page event status is reset every time a page loads.

Testing Click Interaction Events

To test click-based interaction events without leaving the page, hold the command key on a Mac or the Windows key on a PC and then click the link. The link then opens in a new browser tab. After you click the link, the event status is updated in the Monetate Inspector tool from **Pending** to **Occurred**.

Click events do not track right-clicks.

Limitations of Event Builder

Be aware of certain limitations of Event Builder when building and managing events.

- You cannot edit events built in Event Builder once you create them.
- Event Builder can only track elements that already exist on your website.
- You can build a maximum of 300 events. You must delete unused events if you need to create new ones after you reach the limit.
